LA THÉORIE DES JEUX ET LES MODÈLES D'ÉQUILIBRE CONCURRENTIEL

(The Theory of Games and the Models of Competitive Balance)

"Cahiers du Centre d'études de recherche opérationnelle" (Belgium), Vol. 9, No. 2, 1967

The first paragraph of the paper briefly reminds the essential definitions and principles of the theory of games with n players, of the non-cooperative and of the cooperative theories. The following paragraph describes an economic model with a finite number of participants, as well as Aumann's economic model with a countless set of participants where the set of players is represented by the interval 0, 1. In the third paragraph a comparison is made between the games of strategy and the economic models. This last paragraph brings out the relations existing between the various notions of balance defined for each of the models presented.
