(Object and Method of the Science of Production Management)

"Ekonomicheskie nauki" (U.S.S.R.), 10, No. 10, Oct. 1967, pp. 24—32.

The establishment of the relations between the participants to social production — between the state and the workers, between the state and the enterprises, between the enterprises and the workers —, the study of the conditions for developing the maximum initiative of the workers in the labour process, the use of the rules of socialist economy in view of improving the efficiency of social production, etc., constitute the subject of the science of production management.

The author analyzes the problems regarding the aim, object and method of the science of production management and its place among other sciences and categories used in research. Particular attention is granted to the relationship of the science of production management with cybernetics. Stressing the particular part played by cybernetics in solving the technical aspects of the problems of production management, the author concomitantly shows its limited character with regard to the tackling of the socio-economic aspects of management.
