Budil, A. Werner:

RATIONALIZING OF MANAGEMENT STILL OPEN TO IMPROVEMENT

(*Die Rationalisierungsreserven in Büro sind nicht ausgeschöpft*)

"Organisator" (Switzerland), No. 593, 1968.

The author critically analyzes the network graph method and makes an attempt to lay bare the objective and subjective causes of the relatively restrained domain in which this method is spread. The main objective causes are considered to be the insufficient analytic

qualities of most members of the managing staff and the difficulties met with in drawing up faultless network graphs. Pointing out that not even electronic computers are able to correct the errors contained in a network graph, the author points out that this objective cause also generates in most cases the main subjective cause originating in the subconscious of the same managing staff.
