GENERALIZED PRODUCTION FUNCTIONS

The Review of Economic Studies (Britain) No. 2, April 1969

All known production functions take into consideration a constant yield. In this paper it is assumed that the yield is variable.

In the hypothesis that the yield and elasticity coefficient of factor substitution are variable, the authors show the way in which generalized production functions can be obtained and a few of their important properties are determined.

The last part of the paper shows how the parameters of these functions can be estimated.
