THE INTERDEPENDENCE OF ECONOMIC AND NON-ECONOMIC, OF MEASURABLE AND NON-MEASURABLE FACTORS IN THE DEVELOPMENT ANALYSIS

J. Bajec, Department of Economics, University of Belgrade, (Yugoslavia)

The author starts from the theoretical concept according to which development is a multidimensional phenomenon, a large and complex system, which covers all the relevant economic and noneconomic, material and non-material aspects of development.

The consideration of development under the aspect of the whole, the totality calls for a systems approach in the analysis, and this is the research of interrelated and interdependent sub-systems and their elements, the identification of the most important relations and the stressing of priorities.
