CYBERNETIC CULTURAL-ECONOMICAL SYSTEM

C. Belea, University of Craiova, and P.I. Zamfirescu, Editura tehnică, Bucharest, (Romania)

This paper presents a concept of a cybernetic, cultural-economical system (superior in performance to a real one which works in a quasi-open circuit), whose model (an informatic system with feedback loops) serves as a basis for simulation and by the subsequent adoptation of a criterion of low optimum, permits a rational realization.
