ALGORITHMIZED PROCEDURES OR HOW TO CUT DOWN THE RED TAPE

M. Kempisty, Laboratory of Economic Cybernetics, Warsaw , (Poland)

The author intends to present a certain method for improving of all processes taking place in industrial or administrative systems. The object of the above study is a process arbitrarily selected by the investigator (among many processes taking place in the above mentioned systems). This selected process is considered as a model of a particular type, termed here an algorithmized procedure. The method presented here is only apparently a new one. Actually it is only a conglomeration of many well known methods, such as theory of graphs, network analysis, theory of algorithms, systems analysis etc.
